Phytochemical Reference Standards

ChromaDex is the leading provider of phytochemical reference standards, botanical reference materials, and research grade materials for the natural products industry. In 2017, we also started selling our flagship ingredient Nicotinamide Riboside as our branded consumer product called Tru-Niagen. Today, we continue to stay true to our DNA; providing close to 2,000 phytochemicals and 400 botanical reference materials in our catalogue. Our Phytochemical and Botanical standards are used in a variety of different market segments such as:

- Dietary Supplements
- Food & Flavors

- Pharmaceutical
- Biopharmaceutical
- Herbs, Botanicals, Extracts, Essential Oils
- Hemp/CBD/Cannabis
- Skincare/Cosmetics

All of our Botanical and phytochemical standards are available in a library plate format. We also provide contract R&D Services - extraction, isolation, purification and characterization of various natural products. We look forward to working with you and your colleagues on your next research project.

Contract Services

ChromaDex has acquired a wide range of experience and expertise in the natural products area. Our base in isolation of reference standards, reference material development, and analytical testing has led to the formation of a world class team of Natural Product Chemists, Analytical Chemists and Pharmacognosists. ChromaDex Contract Research Services can help customers solve a wide variety of challenges, from sourcing appropriate raw materials and identification of new compounds to process development for large scale manufacture. Some examples of contract research services include:

- Target compound isolation
- Botanical sourcing & compound identification via MS or NMR
- Synthetic chemistry
- Process development

This Contract Research Service is ideal for any organization that wants to leverage the experience of our expert team to solve problems or to aid in the development of new products.

Botanical Reference Materials

Botanical Reference Materials (BRMs) are well characterized materials sampled from specific plants and plant parts. ChromaDex offers a product line of Botanical Reference Materials (BRM) to provide users with the tools necessary to better evaluate botanical raw materials. BRMs are typically freeze-dried and ground plant material. Their Certificate of Analysis show an HP-TLC test method, profile image, and may also include macro and microscopic images. ChromaDex offers a wide range of BRMs grades with varying degrees of characterization. The available grades of Botanical Reference Materials are:

- **Vouchered Botanical Reference Materials (VBRMs)** - VBRMs are highly characterized Botanical Reference Materials. The Certificate of Analysis for ChromaDex VBRMs includes acroscopic and microscopic images with HP-TLC fingerprints to confirm identity of the material. In addition, a voucher is collected at the time of harvest and the plant is visually identified. ChromaDex retains access to the full vouchered specimen that can be used for authentication later. Upon request, an image of the voucher and/or full botanical authentication at an additional cost can be supplied.
- **Botanical Reference Materials (BRMs)** - BRMs are well characterized Botanical Reference Materials. The Certificate of Analysis for ChromaDex BRMs includes both macroscopic and microscopic images with HP-TLC fingerprints to confirm the identity of the material.
- **Reagent Grade Botanical Reference Materials (RGBRMs)** - RGBRMs are Botanical Reference Materials characterized only by HP-TLC fingerprint analysis, detailed on their Certificates of Analysis.
- **Extract Botanical Reference Materials (XBRMs)** - XBRMs are powdered extracts of Botanical Reference Materials from a specific plant biomass. The Certificate of Analysis for ChromaDex® XBRMs includes HP-TLC fingerprints and quantitative HPLC/GC analysis of major chemical markers. As the extraction process cannot be guaranteed, they are not a substitute for actual Botanical References Materials. XBRMs should be used along with Reference Standards to provide robust analytical results.

Phytochemical Reference Standards

Choosing the correct Phytochemical Reference Standards is essential to the success of your quality management program or research project. ChromaDex offers three different product grades to suit your technical and budgetary needs. These product grades are differentiated by the level of characterization and testing performed and reported on the certificate of analysis. The below information will guide you in choosing the right product grade for your use.

- **Primary Analytical Standards (P)** - Primary Standards are orthogonally characterized by multiple analytical techniques. These products include a complete certificate of analysis for each lot that lists adjusted (as-is) purity calculated by HPLC or GC chromatographic purity, Karl Fischer (water content), and GC (residual solvent). The identity of these standards is confirmed with Mass Spectrometry and NMR. The certificate of analysis includes analytical conditions, chromatograms, and spectra for your reference, allowing you to replicate the tests in your laboratory. When utilizing a reference standard for quantitative analysis, the best choice is a Primary Standard.
- **Analytical Standards (AS)** - Analytical Standard grade is a step below our Primary grade regarding the level of characterization reported on the certificate of analysis accompanying each lot. The purity of these products is determined by HPLC or GC chromatographic purity. Identity is confirmed by one technique, typically Mass Spectrometry. Water and residual solvent content are not reported for Analytical Standards.
- **Reagent Grade Chemicals (RG)** - Reagent Grade Chemicals are suitable as fine chemicals for many laboratories. However, they are not intended for use as reference standards. The certificate of analysis for RG chemicals contains basic physical properties, but the materials are not characterized for purity. As a result, RG chemicals are not suitable for direct quantitative use.
